Course Summary

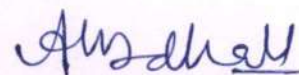

The present value-added program referred to general preparation required for competitive examinations. The main goal of the program was to understand the general nature of the topics, learn the basic concepts behind each topic, learn tips and tricks for solving questions, and learn the skills necessary to solve papers, time to practice and improve.

The modules were intended to provide students with a range of reasoning skills that would enable them to improve their employability index and to succeed in their fields of specialization. These skills are essential for building a stronger connection with the environment in which students operate. Understanding these skills will enable students to effectively meet the challenges in cracking competitive exams. The modules also encouraged students to think critically, apply basic math skills to interpret data, improve problem-solving skills, and develop knowledge of numerical skills, and use tips and tricks to solve questions. It helped the students learn, save time, do all kinds of calculations and questions asked during various selection processes. The modules facilitated to understand the importance of critical thinking, identify core skills associated with critical thinking, demonstrate the difference between deductive and inductive reasoning, and identify logical fallacies, ambiguities, and confusions.

Course Summary

Add on program on bioanalytical techniques was organized for postgraduate students. The course was designed to acquaint with the fundamental aspects of instrumentation which are routinely used in research labs, clinical laboratories and industries. The students ardently took part in all the sessions and were benefitted of learning the working principles, calibration and possible applications of chromatography, microscopy, electrophoresis, immunosorbent assay, blotting techniques as well as spectroscopy. The knowledge gained out of this course can be well extrapolated for qualitative and quantitative analysis of biological samples in academic, industries and designing of a research project and execute it.

Course summary

A training program on Chromatographic Techniques was organized at PIMS for the UG students. The training offered familiarity with fundamental concepts of partition coefficients, skills of column packing, technique of sample elution and separation optimization. The participants gained the broader prospects of core skills to parse existing chromatographic protocols and identify the key factors influencing a specific chromatography experiment. The training efficiently delivered the skills for separation and characterization of analytes explicitly chemical mixtures, plant extracts, pharmaceuticals, environmental samples, and hydrocarbons. The students will have the ability to interpret data from analytical separation methods.

Course summary

To succeed, think tanks need at least four elements. So, this course is targeted to Students to improvise good ideas, a coalition of actors to support those ideas, the institutional capacity (including resources) to nurture and shepherd those ideas in a dynamic context, and the ability to seize the moment when the timing is right. Innovative thinking can be used in many different situations, such as when trying to come up with new product ideas, finding solutions to existing problems, developing strategies, or any other situation that requires original and creative thinking. Innovative thinking can also be used to develop new approaches to existing ideas, as well as finding unique solutions to complex problems. In addition, it can be used to identify new opportunities for growth and development.

In conclusion, creativity and innovation are not only two relevant moments, different and successive one to another within the development process, but belong to different logical levels. Innovative Thinking could be defining a way of looking at problems or situations from a fresh perspective that suggests unorthodox solutions.
